

PACKAGING FOR SHIP SHIPMENTS.

This kind of packaging is designed to prevent the damages which may occur during long ship shipments, in particular to prevent any sheet deformation (waves) from the humidity and moisture.

The packaging offered for ship shipments is based on a 4-way fumigated reinforced wooden pallet. On the pallet is placed a corrugated plastic cardboard sheet, a corrugated carton cardboard sheet, the bottom part of the special vacuum moisture-proof bag.

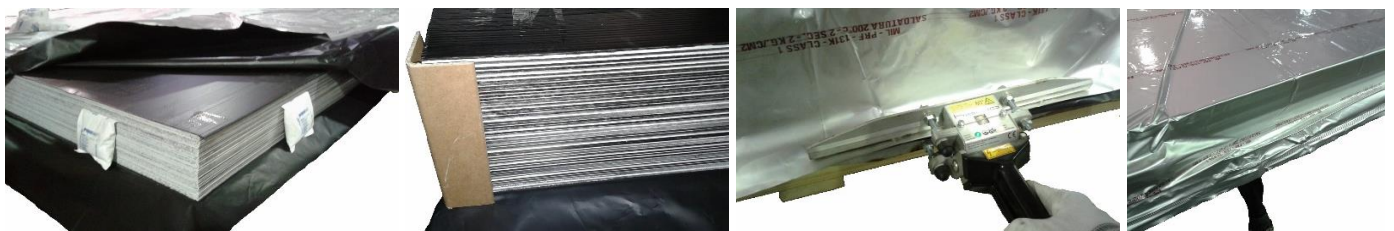

The mirror sheets are placed following the sorting (for the mixed pallet) required by the customer. The standard quantity of goods on each full pallet is about 1 ton.

Location: Hide Park, Sydney | Labyrinth maze of mirrors - Art installation

Over the mirrors, is placed a corrugated plastic cardboard sheets and the top part of the special moisture-proof bag. Before the sealing of the special bag, a proper quantity of silica bags (to keep the humidity under control) and the angular carton protections are placed inside the moisture-proof bag.

The perimeters of the 2 parts of the special moisture-proof bag are partially melted together, the air is removed and then the special vacuum moisture-proof bag is completely sealed.

The special bag is covered by a corrugated carton cardboard, the pallet is wrapped by an extensible PE film and strapping bends on both the directions are placed with edge protections. Identification labels are placed on the two long sides, with the destination and the information (about documents and products) useful for clearance, written in English and supported by the standard logistic iconographic precaution logos.
