

## PACKAGING FOR TRUCK TRANSPORTS.

This kind of packaging is designed to prevent the damages which may occur during truck transports and, in particular, to prevent sheet damages for accidental exposition of the packaging to water.

The packaging offered for truck deliveries is based on a **2-way wooden pallet**. On the pallet is placed a **corrugated plastic cardboard sheet**, a **corrugated carton cardboard sheet**.

The mirror sheets are placed **following the sorting** (for the mixed pallet) required by the customer. The standard quantity of goods on each full pallet is about 1 ton.

Location: Hide Park, Sydney | Labyrinth maze of mirrors - Art installation

Over the mirrors, is placed a **corrugated plastic cardboard sheet** and a **nylon cover**. The cover is able to protect top and sides of the mirrors from any problem from accidental and prolonged contact with water. The **angular carton protections** are placed on the edges of the pile.

All is covered by a **corrugated carton cardboard**, to avoid mechanical damages, then the pallet is wrapped by an **extensible PE film** and **strapping bends** are placed on both the directions with **edge protections**.

**Identification labels** are placed on the two long sides, with the destination and the useful information to identify products and connected documents. A second label is present with standard logistic iconographic precaution logos. The labels are normally in English and in the Customer language too.
